

### The Autumn-Winter season in An Giang and Dong Thap

While most of the rice planted area in An Giang is at tillering stage, fields in Dong Thap have entered maturity condition, coming closer to the Autumn-Winter harvest. Before that, a part of rice extent earlier transplanted in Dong Thap was harvested despite the severe drought and salinity intrusion by the end of March 2016.

Two seasons are overlapping in the same region: Summer-Autumn and Autumn-Winter. When the Autumn-Winter season starts, the Summer-Autumn crop is milking. Field survey data by RIICE project on 3 July, 27 July, 8 August, 20 August, 1 September, 13 September and 25 September 2016, with reference to rice production progress reports from An Giang and Dong Thap's DARDs<sup>1</sup> have matched exactly the rice cultivation situation during the second six-month period in the region captured from the space.

*Rice extent by date derived from satellite data*

*Source: RIICE Project*

Analysis of satellite images up to 1<sup>st</sup> September 2016 shows an on-going transplantation progress in An Giang, while in Dong Thap, the Autumn-Winter rice area got fully transplanted since the middle of July. According to An Giang's statistical data, up to 20<sup>th</sup> September 2016, 174.630 ha of Autumn-Winter rice has been transplanted, accounting for 87% of the projected plan. Before that, the progress report released 21<sup>st</sup> July 2016 by Dong Thap DARD also referred to the completion of rice transplant since middle of July.

Observations from outputs of 12 time-series images from 10<sup>th</sup> April to 1<sup>st</sup> September 2016 mark significant difference in start-of-season dates (SoS) between An Giang and Dong Thap provinces. In Dong Thap, the major SoS are 10-20 April and 10-20 June; while in An Giang, the period from 15 July to 20 August is noted with large area of transplanting activity. The SoS in An Giang is 1.5-2 months later than in Dong Thap. The latest field observation on 25 September indicated that a part of the rice area in Dong Thap had been harvested and the remaining extent was expecting to be finished within 1-2 weeks. At the same time, in An Giang, a majority of rice field was at tillering stage.

Date (M/D/Y)	Dong Thap	An Giang

The map of SoS in An Giang and Dong Thap, produced from a time-series imagery of 12 Sentinel-1A scenes allows to observe transplanting dates with accuracy from 6 to 12 days.

SoS map of An Giang and Dong Thap for Autumn-Winter 2016 season

Source: RIICE Project

Between early June to late September 2016, hot weather with average daily temperature from 32-34<sup>0</sup>C around Long Xuyen quadrilateral was observed. Monthly accumulative rainfall in June, July, August and September was 61mm, 18mm, 23mm and 158mm respectively. It is obvious that without adequate water supply from the local irrigation system, this low rainfall has caused negative impacts on the Autumn-Winter rice crop.

Up to 1<sup>st</sup> September 2016, RIICE's expert group is able to provide the mid-season rice extent map for An Giang and Dong Thap provinces, as well as issuing early yield forecast at commune level. Even so, in this case, it is a bit early to produce yield forecast for An Giang. A more stable output of yield estimation could be given after the rice plants pass the flowering stage, about the third week of October 2016.

*Source: RIICE Project*

In the coming weeks, before the season's end, RIICE will analyse and produce the final outputs including estimations of end-season rice area, yield and production. This data will be compared with that of the General Statistics Office (GSO) to determine the level of agreement.

Information reported in this bulletin has been generated using MAPscape-RICE, Oryza and data acquired by Sentinel-1A (owned by EU and developed & operated by ESA). Background map ©OpenStreetMap contributors.
